How LOGIX Provides the Most Reliable Business Internet in Texas

Every minute, the internet handles 188 million emails, 231,840 Skype calls, 208,333 Zoom meetings, 52,083 Microsoft Teams video conferences, 4.4 million gigabytes of data and \$1 million in consumer purchases.

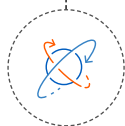

Now think about what happens when the business internet is down. It's impossible to send or receive emails, have video conferences or transmit data. Your customers may not be able to buy or use your products or services. It's a frightening scenario.

If your business is affected, that's a serious problem. Productivity plummets, customers get frustrated and your business suffers. That's why you must work with a reliable Texas business internet provider.

LOGIX Fiber Networks offers the most reliable business-class internet service, including:

99.999% uptime. LOGIX guarantees you less than 6 minutes of downtime a year in its service-level agreement (SLA). If your downtime exceeds that amount for any reason, LOGIX will reduce your bill to compensate you for the lost time.

Redundant infrastructure. LOGIX has a fully redundant infrastructure and geographically diverse data centers. If there is a problem somewhere along the line, the company can reroute traffic so you do not skip a beat. That's why hurricanes in Houston and tornadoes near Dallas and Fort Worth did not cause any service interruptions for LOGIX business customers, while many telecoms and other internet providers lost connectivity.

Texas-based 24/7 year-round monitoring. LOGIX staffs a Texas-based network operations center. Technicians monitor speed, performance and security 24/7 year-round and resolve problems promptly.

Texas-based support teams. LOGIX has customer care and support teams in Texas. You will not be talking to someone from a third-party company or subcontractor if you have questions or concerns. If there is a problem that requires a technician, a LOGIX staff member will address it directly.

280,000 miles of fiber. LOGIX offers a full range of fiber internet speeds, from 100 Mbps to gigabit speeds 10 Gbps and higher that are dramatically faster than cable, digital subscriber line or copper connections. And unlike other business internet providers, LOGIX has 280,000 miles of fiber throughout Texas. Fiber is the most reliable way to deliver high-speed internet. It is stronger than cable and copper lines and is less likely to break. Also, since fiber does not need power applied to transmission lines like other methods, it's less susceptible to severe weather, and immune to nearby electrical interference.

Dedicated connections. LOGIX can provide dedicated fiber to your business, just as it does for 3,000 enterprise buildings in Dallas, Austin, San Antonio and Houston and 100 data centers throughout Texas. Dedicated fiber means that you will not be sharing your line with others. This is important because sharing can degrade performance during peak demand times.

Symmetrical speeds. Consistent symmetrical speeds are important to your company, especially if you are doing a lot of business in the cloud. Not all business internet providers can say that. With LOGIX, uploads and downloads will both be lightning-fast. Unlike some national business internet providers, residential providers and cable providers, LOGIX does not throttle your speeds during peak times. LOGIX offers business-class internet service with unlimited plans, no data caps and no throttling.

Security. Anytime you're doing business online, security is a top concern. If you work with a cloud service provider such as Amazon Web Services, Microsoft Azure, Google or Oracle, LOGIX can provide a reliable, private and secure connection to reach the cloud. Private Ethernet network connections can connect you to the cloud without sending data over the public internet.

Data centers. LOGIX operates geographically diverse and redundant data centers throughout Texas. If you are looking for a secure and reliable colocation provider, LOGIX offers robust connectivity options, flexible and scalable space, and customized solutions whether you need a data hall, cage or multiple racks. LOGIX colocation data centers are carrier-neutral and provide redundant power with dual-input and static transfer switches, which enable the company to offer 100% SLAs.

You Need the Most Reliable Business Internet Provider in Texas

The 2020 Cloud Computing Survey reported that 92% of organizations are doing some business in the cloud. If your internet service is not reliable, you lose access to your data and will not be able to access critical files or documents when you need them. Also, if you are one of many that use voice over Internet Protocol for your business phone service, your phones stop ringing when the internet is down, and you won't be able to communicate with co-workers or customers.

Simply put - downtime costs money. The average cost of downtime now exceeds \$10,000 per hour, even for small businesses. For large enterprises, that number can exceed hundreds of thousands of dollars an hour. Your business simply cannot afford anything but the most reliable Texas business internet for your organization.
